

Usability Test Report: WayFind

Winter 2025

Team B

Levi Cooper, Kwame Adubofour, Samuel Ntadom, Jacob Foote, Sebastian Grabill

The purpose of this test was to evaluate how users interact with the WayFind app, identify usability issues, and plan improvements based on observed behavior and feedback. Participants completed a series of tasks including logging in, browsing and filtering adventures, locating specific tokens, viewing personal statistics, and creating new adventures.

The results from the test and the development team's plans to address the feedback and concerns are as follows:

- Profile page crash was observed on Android devices, multiple users experienced crashes when accessing the profile page user information, preventing them from managing account settings.
The development team has identified this as an Android-specific issue and has already worked on a fix to stabilize the profile section on affected devices.
- Most users had some difficulty finding specific tokens on the map – Users struggled to locate tokens using the map interface, often resorting to scrolling or searching without clear visual cues.
The team will improve token visibility on the map by adding better searchability within the map view, and guidance on how to access tokens.
- Some users found it challenging to filter adventures by region because of the unclear guidance for region-based filtering, and others noted that scrolling through the lengthy filter options was cumbersome.
We will streamline the filter interface by adding search functionality within filters, improving region labels, and reducing scroll burden through categorization.
- Users had confusion around token purpose and social features, they were unsure what tokens were used for and expressed interest in more social or collaborative features.
A help section or tutorial will be added to explain token mechanics. Social features such as group adventures are under consideration for future updates.
- Positive feedback on homepage and creation flow – Users praised the app's homepage layout, adventure cards, and the straightforward process for creating new adventures.
These elements will be maintained and used as a reference for improving other sections of the app.

Overall the app was perceived as visually clean, easy to navigate, and conceptually engaging. Users appreciated the adventure cards, filtering options, and creation workflow. Key areas for improvement include stability on Android, clarity of map and token interactions, and additional onboarding or guidance for new users.
